DIGITAL INFORMATION INFRASTRUCTURES ON THE SEMANTIC  
INTEROPERABILITY  
IN BUILDINGS AND 4-5TH GENERATION DISTRICT HEATING AND  
COOLING SYSTEMS

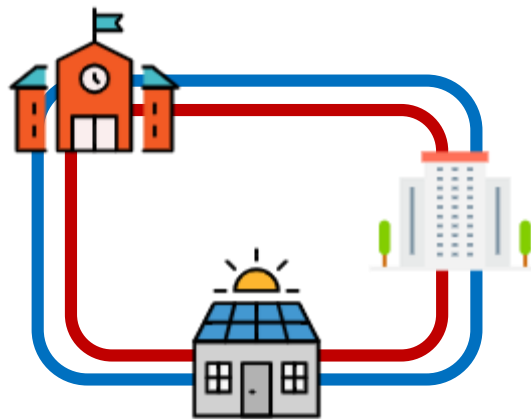

Zeng Peng, KTH

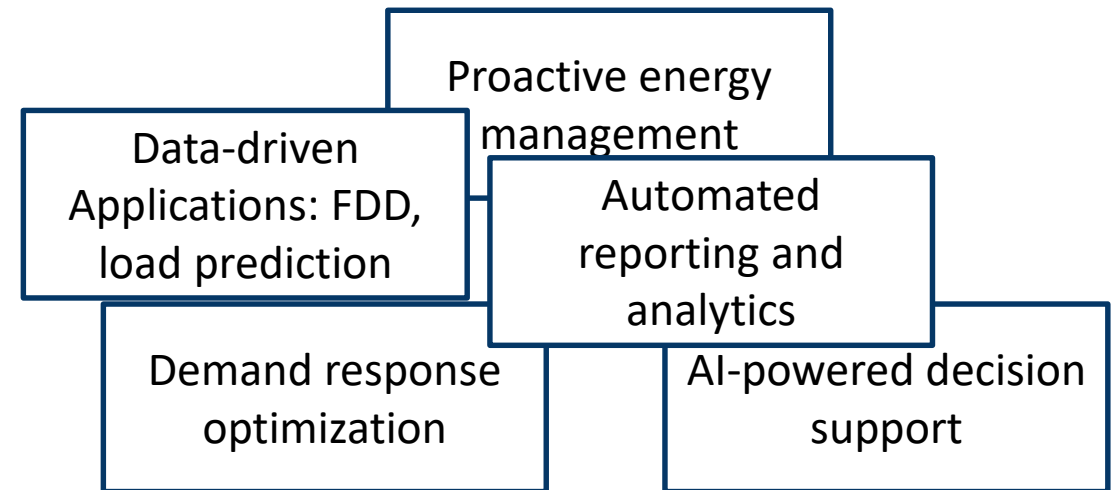

# Smart buildings and DHC networks

Smart buildings and DHC networks are expected to be equipped with

- **Advanced sensing**
  - Large scale deployment of sensors
- **Data management**
  - Recording, Storage, Retrieval
- **Smart applications**
  - Fault detection & diagnosis, load prediction
- **Control technologies**
  - Supports the development and deployment of optimal control strategy

Physical systems

Smart applications

# Challenges

**The complexity of 4-5GDHC networks presents unique challenges:**

- Multiple decentralized renewables
- Distributed storage systems
- The low-temperature nature of DHC
- Smart control strategy
- Big data

A graph visualization of a building district

**Advanced thermal networks evolve into complex graphs with countless nodes and intricate topologies**

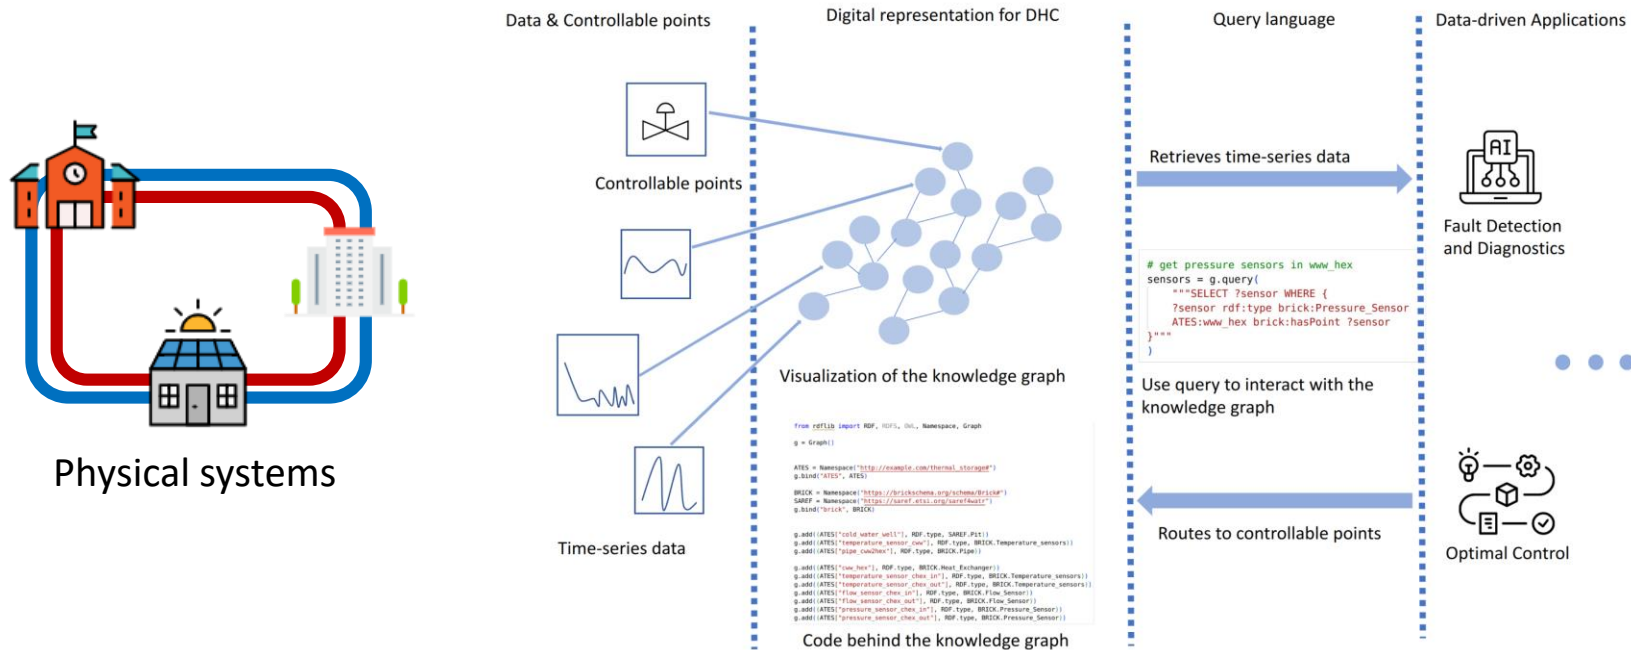

**The data and information flow is complex in this graph**

**The roadblock: fluent transmission and effective utilization of data and information**

# The idea

**A layer that models the complex graph of thermal networks:**

- Support querying language (database technology)
- Computer program can read & write data and information unambiguously

How smart applications interact with digital representations of DHC systems to acquire data and information.

# Some preliminaries

## Two key semantic web technologies:

- Resource Description Framework (RDF) for constructing the graph
- SPARQL as the standard query language, enabling efficient modeling and querying of data

Resource Description Framework (RDF)

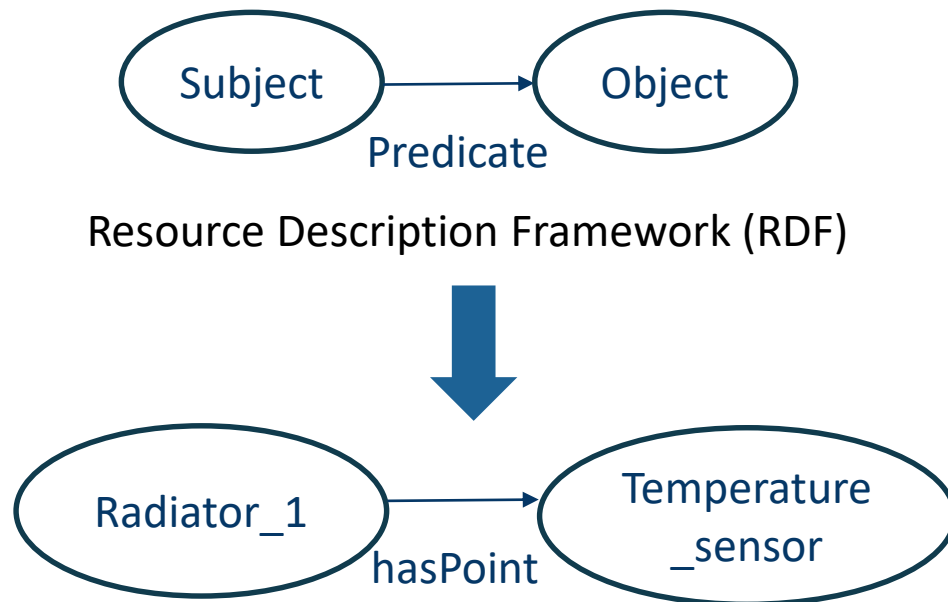

```
SELECT *  
WHERE {  
  BIND(ex:sw003 AS ?targets)  
  ?src ex:linksWith ?targets .  
}
```

SPARQL

# Some preliminaries

## Two key semantic web technologies:

- Resource Description Framework (RDF) for constructing the graph
- SPARQL as the standard query language, enabling efficient modeling and querying of data

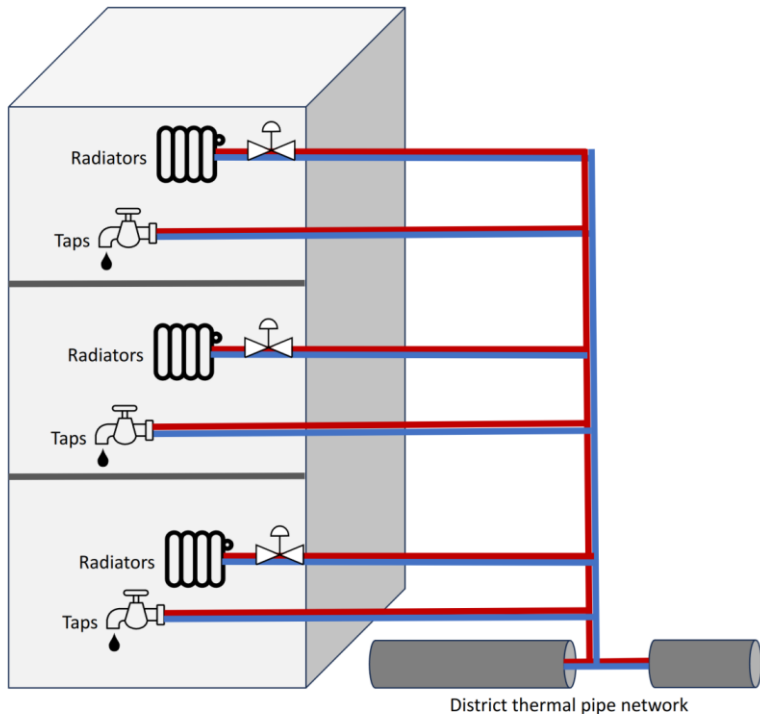

```
SELECT *  
WHERE {  
  BIND(ex:sw003 AS ?targets)  
  ?src ex:linksWith ?targets .  
}
```

SPARQL

Get the temperature sensor in room 101  
in building A

# An example

A building connected to district thermal pipe network

```
Building = Namespace("http://example.com/Buildings#")
g.bind("Building", Building)

BRICK = Namespace("https://brickschema.org/schema/Brick#")
g.bind("brick", BRICK)

g.add((Building["hot_water_distribution_system"], RDF.type, BRICK.Water_Distribution))

g.add((Building["pipe_1"], RDF.type, BRICK.Pipe))
g.add((Building["floor_1"], RDF.type, BRICK.Floor))
g.add((Building["room_101"], RDF.type, BRICK.Room))
g.add((Building["hot_water_meter_101"], RDF.type, BRICK.Hot_Water_Meter))
g.add((Building["radiator_101"], RDF.type, BRICK.Radiator))
g.add((Building["temperature_sensor_101"], RDF.type, BRICK.Temperature_Sensor))
g.add((Building["flow_meter_101"], RDF.type, BRICK.Flow_Meter))

g.add((Building["floor_2"], RDF.type, BRICK.Floor))
g.add((Building["pipe_2"], RDF.type, BRICK.Pipe))
g.add((Building["room_201"], RDF.type, BRICK.Room))
g.add((Building["hot_water_meter_201"], RDF.type, BRICK.Hot_Water_Meter))
g.add((Building["radiator_201"], RDF.type, BRICK.Radiator))
g.add((Building["temperature_sensor_201"], RDF.type, BRICK.Temperature_Sensor))
g.add((Building["flow_meter_201"], RDF.type, BRICK.Flow_Meter))
```

A simplified semantic model using RDF triplets

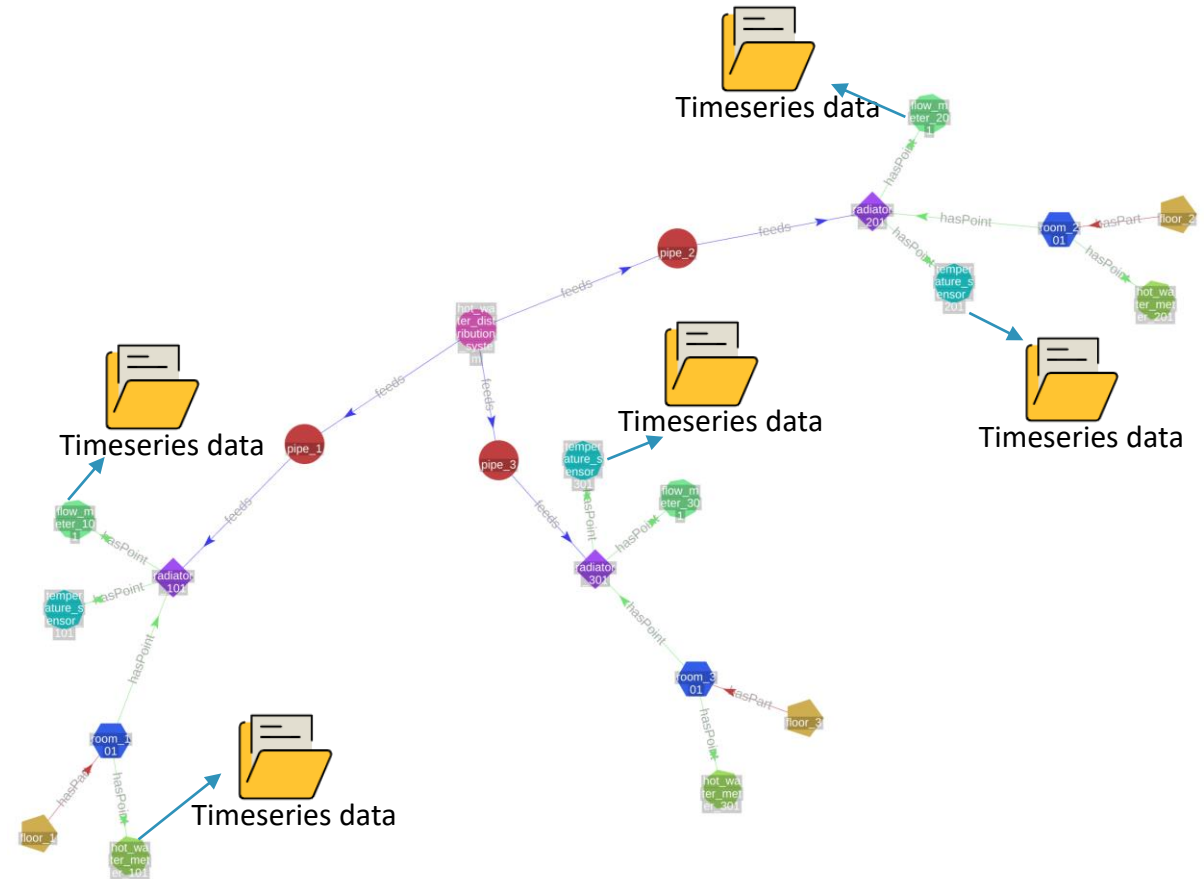

# An example

A building connected to district thermal pipe network

Visualization of the semantic model with timeseries data

# An example

If we want to find all temperature sensors

```
sensors = g.query(  
    """SELECT ?sensor WHERE {  
        ?sensor rdf:type brick:Temperature_Sensor  
    }"""  
)
```

SPARQL query

```
(rdflib.term.URIRef('http://example.com/Buildings#temperature_sensor_101'),)  
(rdflib.term.URIRef('http://example.com/Buildings#temperature_sensor_201'),)  
(rdflib.term.URIRef('http://example.com/Buildings#temperature_sensor_301'),)
```

Results

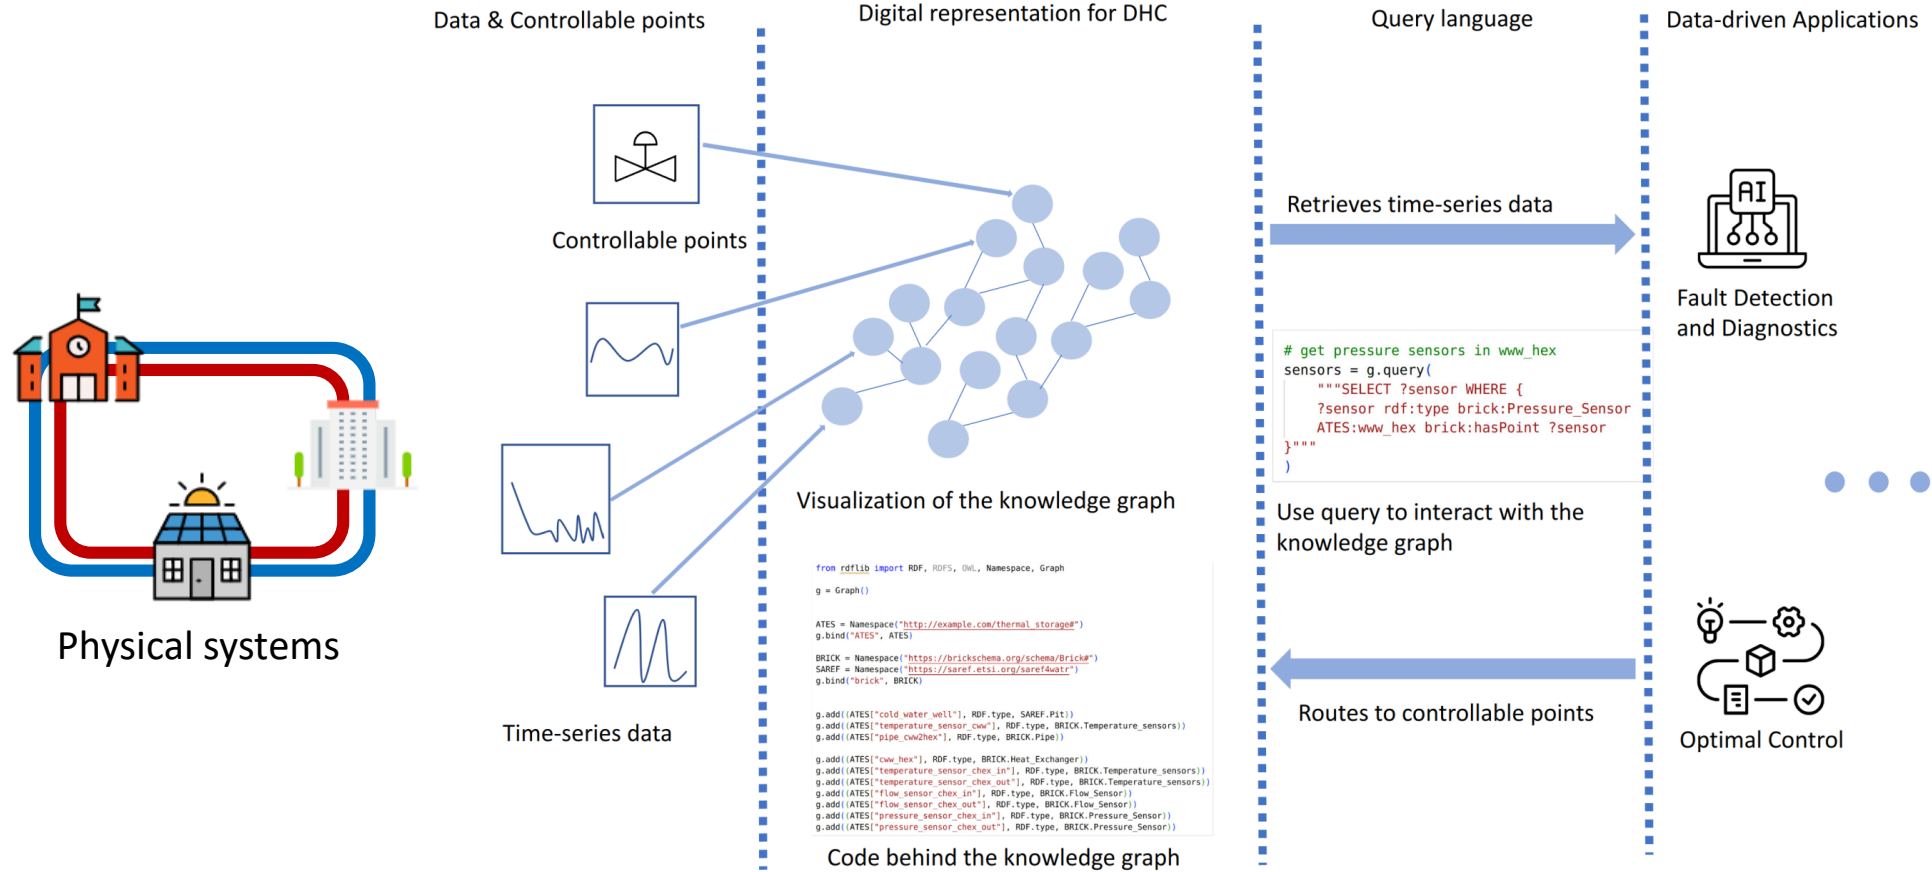

If we just need the temperature sensor from Room 301

```
sensors_floor3 = g.query(  
    """SELECT ?sensor WHERE {  
        ?sensor rdf:type brick:Temperature_Sensor .  
        ?radiator brick:hasPoint ?sensor .  
        ?room brick:hasPoint ?radiator .  
        Building:floor_3 brick:hasPart ?room  
    }"""  
)
```

SPARQL query

```
(rdflib.term.URIRef('http://example.com/Buildings#temperature_sensor_301'),)
```

Results

How smart applications interact with digital representations of DHC systems to acquire data and information.

# A challenge

- **Standardization**

"Tags" need to be standardized and consistent across & between systems

```
Building = Namespace("http://example.com/Buildings#")
g.bind("Building", Building)

BRICK = Namespace("https://brickschema.org/schema/Brick#")
g.bind("brick", BRICK)

g.add((Building["hot_water_distribution_system"], RDF.type, BRICK.Water_Distribution))

g.add((Building["pipe_1"], RDF.type, BRICK.Pipe))
g.add((Building["floor_1"], RDF.type, BRICK.Floor))
g.add((Building["room_101"], RDF.type, BRICK.Room))
g.add((Building["hot_water_meter_101"], RDF.type, BRICK.Hot_Water_Meter))
g.add((Building["radiator_101"], RDF.type, BRICK.Radiator))
g.add((Building["temperature_sensor_101"], RDF.type, BRICK.Temperature_Sensor))
g.add((Building["flow_meter_101"], RDF.type, BRICK.Flow_Meter))

g.add((Building["floor_2"], RDF.type, BRICK.Floor))
g.add((Building["pipe_2"], RDF.type, BRICK.Pipe))
g.add((Building["room_201"], RDF.type, BRICK.Room))
g.add((Building["hot_water_meter_201"], RDF.type, BRICK.Hot_Water_Meter))
g.add((Building["radiator_201"], RDF.type, BRICK.Radiator))
g.add((Building["temperature_sensor_201"], RDF.type, BRICK.Temperature_Sensor))
g.add((Building["flow_meter_201"], RDF.type, BRICK.Flow_Meter))
```

```
sensors_floor3 = g.query(
    """SELECT ?sensor WHERE {
        ?sensor rdf:type brick:Temperature_Sensor .
        ?radiator brick:hasPoint ?sensor .
        ?room brick:hasPoint ?radiator .
        Building:floor_3 brick:hasPart ?room
    } """
)
```

Some existing ontologies

A "Dictionary" that you can lookup

# Ontology?

- The unique requirements of thermal networks.

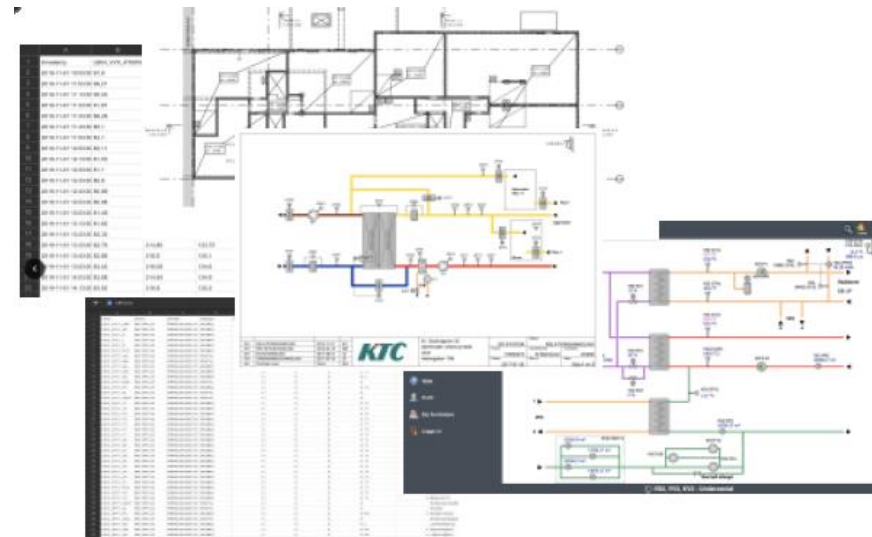

"Dictionary" is not big enough

- Choose which one to follow?

# Some other challenges

- **Standardization**  
"Tags" need to be standardized and consistent across & between systems
- **Automation**  
Manual creation of graphs is time-consuming and error-prone

- **Application**  
Research is needed to fully understand and effectively utilize these graphs in practical applications

# Summary - semantic interoperability for building and DHC

## Semantic Interoperability:

- Read & Write data, exchange information **unambiguously**

## Digital Information Infrastructure:

- (Data) Time series data
  - (Information) Relational information
- 
- (Knowledge) Knowledge derived from data and connectivity patterns

## Ontologies is leveraged for consistency and scalability:

- Provides consistent semantic information across and between systems
- Supports expansion to diverse building and DHC scenarios

This research has received funding from the European Union's H2020 programme under Grant Agreement No.101036656 (HYPERGRYD) and TwinVista Project funded by Swedish Energy Agency (Energimyndigheten)
